EDUCATION

Arizona State University, Tempe, AZ

Aug 2026 – Expected May 2030

Dual B.S., Biological Sciences (Biomedical Sciences) and AI in Business. Barrett, The Honors College.

- McKenna Life Sciences, Business and Entrepreneurship (MLSBE), **inaugural cohort**. A 30-student program run jointly by W. P. Carey and The College: two bachelor's degrees plus an Entrepreneurship and Innovation certificate in four years.
- 2026 AI Scholar cohort. Member, Sun Devil Satellite Laboratory. Entered with 51 credit hours from AP exams.

BASIS Chandler, Chandler, AZ

Aug 2022 – May 2026

- AP Scholar with Distinction. Scores of 5 in AP Biology, AP Chemistry, and AP Physics 1. SAT 1530.

ENGINEERING AND VENTURES

VivaMed BioPharma, Paid Technical Intern

Aug 2026 – Present

Computational drug-candidate screening. Python, Pydantic, Polars, RDKit, Postgres.

- Primary engineer on a computational screening platform for drug candidates: wrote most of its screening engines, the scoring and red-team review stages, and the orchestration that runs them end to end, so each run yields a reproducible, provenance-tracked evidence dossier. More than 300 test files gate every change.
- Built the data layer's safeguards: loaders and reconciliation over a 500 GB Postgres research warehouse (DepMap, ClinVar, FAERS), and a licence gate that stops any engine from reading a source whose terms bar that use. It is on by default, and every bypass needs a recorded reason.
- Merged the platform with the CTO's discovery-engine codebase into one pipeline of 19 cost-ordered gates, so cheap checks eliminate a candidate before expensive ones run, and pulled the scoring logic both had duplicated into one shared package, resolving a constant the two had silently disagreed on.
- Hardened the CTO-led engine suite with verification gates, a default-deny network egress allowlist, database writes that fail loudly instead of silently, and an auto-generated project status site.

Cognifer Labs, Founder

Mar 2026 – Present

Avorio, a native spaced-repetition learning app for macOS and iOS. avorio.ai

- Shipped Avorio to the App Store — version 1.0 approved July 2026, and 1.1 approved and released the same day it was submitted — with the Mac build available as a signed, notarized direct download that updates itself.
- Designed one core so every platform behaves identically: a single engine handles scheduling, storage, Anki import and export, gamification, and AI routing, and both native UIs call straight into it.
- Made switching from Anki lossless: a deck keeps its full history, media, cloze, and image occlusion behind a review step, then re-fits the learner's own forgetting-curve parameters from that history.
- Shipped an AI layer with free on-device paths, so cost is never the barrier: document-to-cards with diagrams, per-card explanations, and a tutor aimed at whatever the learner keeps missing.
- Ran the backend and business model: free flashcard core, paid tiers for cloud AI and sync, checkout live on web and both app stores, eight languages, a test suite gating every change, and Android in progress on the same core.

BioPath, Founder and Sole Engineer

2025 – Present

Drug interaction checker and compound body-impact analysis. biopath.space

- Built a computational pharmacology tool that answers what a compound will do inside a body and whether it is safe with what someone already takes, starting from a drug name, plant photo, plant name, or pill imprint.
- Connected ten scientific databases (PubChem, ChEMBL, Reactome, Open Targets, DGIdb, OpenFDA, RxNorm, PlantNet, Dr. Duke's) into one pipeline: identity, binding targets, 200+ pathways, organ impact, then interaction, dosage, and pregnancy safety.
- Trained a Morgan-fingerprint CNN and MPNN on BindingDB to predict binding affinity across roughly 700 human proteins for compounds with no measured data, cross-checked against measured ChEMBL targets with disagreement flagged rather than hidden. Tanimoto similarity at 0.70 carries side effects and interaction risk over from analogous known drugs.

AlóJefe, Full-Stack Developer (client)

2025 – 2026

- Built the site and backend for a bilingual AI phone assistant for solo contractors: it answers the calls an owner cannot take, qualifies the job, books an estimate with drive-time routing, and texts back a summary in English or Spanish. Next.js on Vercel.

CLINICAL EXPERIENCE

Banner Health, Patient-Facing Volunteer

2024 – Present · 175 hours

- Assisted patients and clinical staff across inpatient and outpatient departments at one of the largest nonprofit health systems in the country. Built a front-desk data system that cut the time it took to log and retrieve patient information.
